Design Model

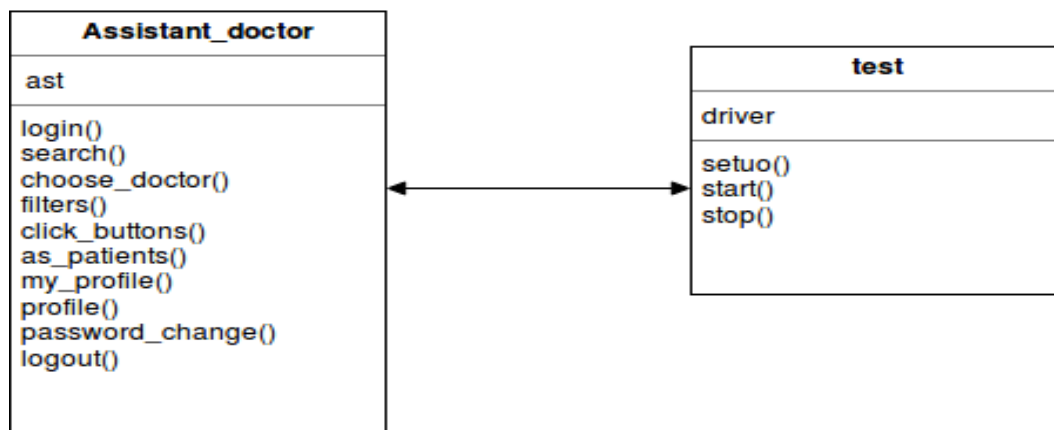

Super Admin role:

1. SuperAdmin	<p>Class state</p> <ul style="list-style-type: none">• It contains the email id of the hospital• It contains the email id of the hospital admin <p>Class behavior</p> <ul style="list-style-type: none">• all the functions in this class automate the verification of following functionalities• login(): the super admin is logged in• add_staff(): call center staff get added and verified if they are displayed• add_hospital(): hospitals get added and verified if they are displayed• password_change(): the password for super admin gets changed
---------------	---

	<ul style="list-style-type: none"> logout(): the super admin is logged out
2. test	<p>Class state</p> <ul style="list-style-type: none"> It contains the driver object It contains the gmail api object which is used for fetching login credentials from gmail <p>Class behavior</p> <ul style="list-style-type: none"> setup(): creates instances for the driver and gmail api classes start(): this method calls all the methods in SuperAdmin class and prints appropriate messages after automation of each feature stop(): closes the driver connection
3. Gmail_Api	<p>Class state</p> <ul style="list-style-type: none"> creds stores the login credentials of the user (super admin) <p>Class behavior</p> <ul style="list-style-type: none"> this class is used to fetch the email ids and passwords of hospitals and call center staff from the emails sent by onward health

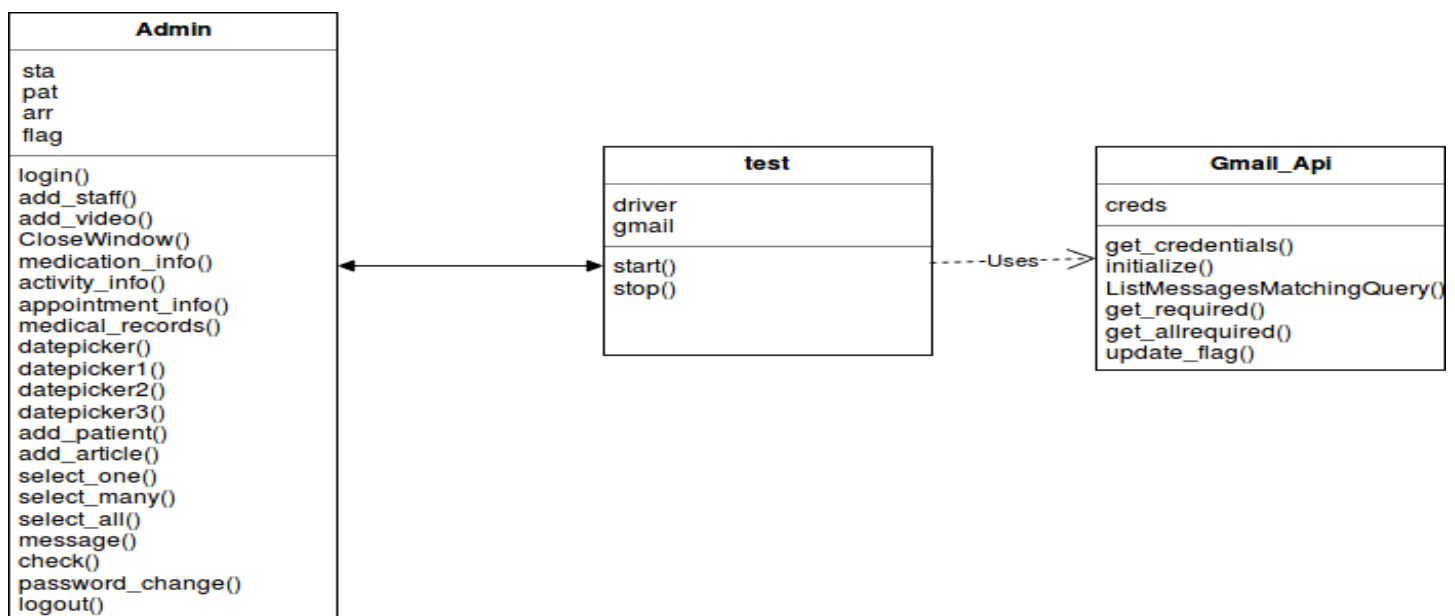

Assistant Doctor role:

1. Assistant_doctor	<p>Class state</p> <ul style="list-style-type: none"> It contains the email id of assistant doctor <p>Class behavior</p> <ul style="list-style-type: none"> all the functions in this class automate the verification of the following functionalities login(): the assistant doctor is logged in search(): searches for patients choose_doctor(): doctor gets chosen filters(): tests the working of search boxes as_patients(): displays the patients under the doctor which we choose my_profile() and profile() are used to edit the profile of the assistant doctor password_change(): the password for super admin gets changed logout(): the assistant doctor is logged out click_buttons() is a helper function
---------------------	--

2. test	<p>Class state</p> <ul style="list-style-type: none"> • It contains the driver object • It contains the gmail api object which is used for fetching login credentials from gmail <p>Class behavior</p> <ul style="list-style-type: none"> • setup(): creates instances for the driver and gmail api classes • start(): this methods calls all the methods in Assistant_doctor class and prints appropriate messages after automation of each feature • stop(): closes the driver connection
---------	--

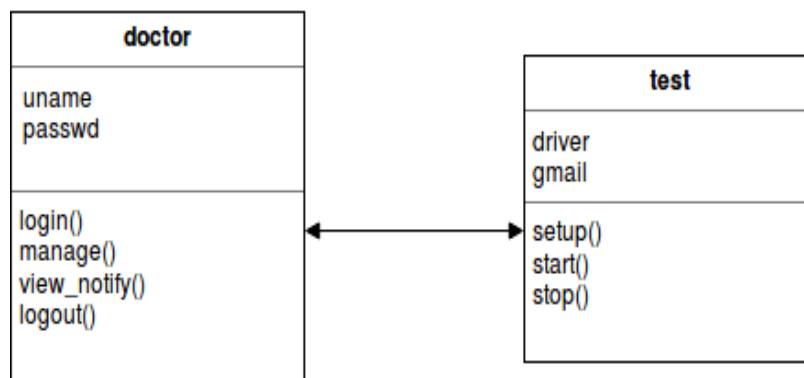

Hospital Admin role:

1. Admin	<p>Class state</p> <ul style="list-style-type: none"> • it contains the email ids of staff and patients • It contains the ids of patients • It stores the state of a patient (whether the patient is activated or deactivated) <p>Class behavior</p> <ul style="list-style-type: none"> • all the functions in this class automate the verification of the following functionalities • login(): the hospital admin is logged in • add_staff(): staff get added and verified if they are displayed • add_video(): videos get added and verified if they are displayed • add_article(): articles are added and verified if they are displayed, CloseWindow() is a helper funtion • message(): sends messages • password_change(): the password for hospital admin gets changed • logout(): the hospital admin is logged out • the rest of the methods are helper methods for the above functions
2. test	<p>Class state</p> <ul style="list-style-type: none"> • It contains the driver object • It contains the gmail api object which is used for fetching login

	<p>credentials from gmail</p> <p>Class behavior</p> <ul style="list-style-type: none"> start(): this method calls all the methods in Admin class and prints appropriate messages after automation of each feature stop(): closes the driver connection
3. Gmail_Api	<p>Class state</p> <ul style="list-style-type: none"> creds stores the login credentials of the user (hospital admin) <p>Class behavior</p> <ul style="list-style-type: none"> this class is used to fetch the email ids and passwords of the staff(doctors, assistant doctors, cms) from the emails sent by onward health

Doctor role:

1. doctor	<p>Class state</p> <ul style="list-style-type: none"> It has the login credentials of doctor <p>Class behavior</p> <ul style="list-style-type: none"> all the functions in this class automate the verification of the following functionalities login(): the doctor is logged in manage(): this method can grant access to the assistant doctors view_notify(): checks the view notifications page logout(): the doctor is logged out
2. test	<p>Class state</p> <ul style="list-style-type: none"> It contains the driver object It contains the gmail api object which is used for fetching login credentials from gmail <p>Class behavior</p> <ul style="list-style-type: none"> setup(): creates instances for the driver and gmail api classes start(): this method calls all the methods in doctor class and prints appropriate messages after automation of each feature stop(): closes the driver connection

CMS role:

1. CMS	<p>Class behavior</p> <ul style="list-style-type: none">• all the functions in this class automate the verification of the following functionalities• <code>login()</code>: the CMS is logged in• <code>add_article()</code>: articles are added and verified if they are displayed, <code>CloseWindow()</code> is a helper function for adding article• <code>send_message()</code>: messages are sent• <code>search()</code>: search boxes functionality is verified<ul style="list-style-type: none">• <code>change_password()</code>: the password for CMS gets changed• <code>edit_profile()</code>: the profile gets edited• <code>logout()</code>: the CMS is logged out
2. test	<p>Class state</p> <ul style="list-style-type: none">• It contains the driver object• It contains the gmail api object which is used for fetching login credentials from gmail <p>Class behavior</p> <ul style="list-style-type: none">• <code>setup()</code>: creates instances for the driver and gmail api classes• <code>start()</code>: this method calls all the methods in CMS class and prints appropriate messages after automation of each feature• <code>stop()</code>: closes the driver connection

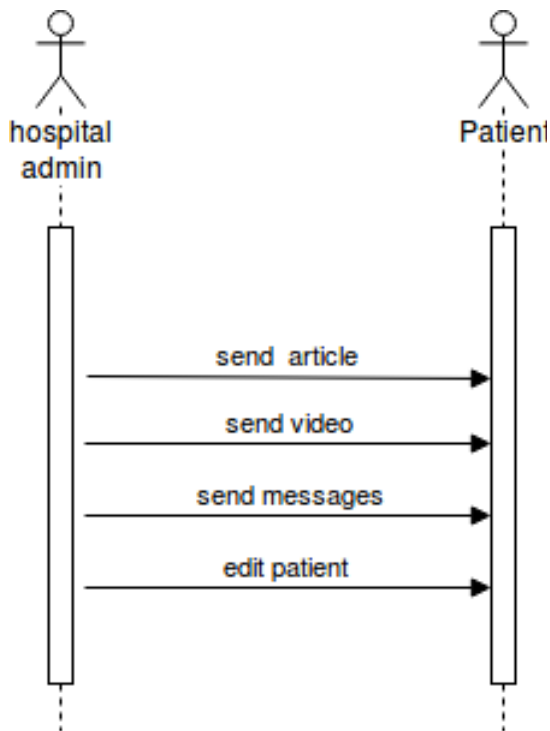

Call Center Staff:

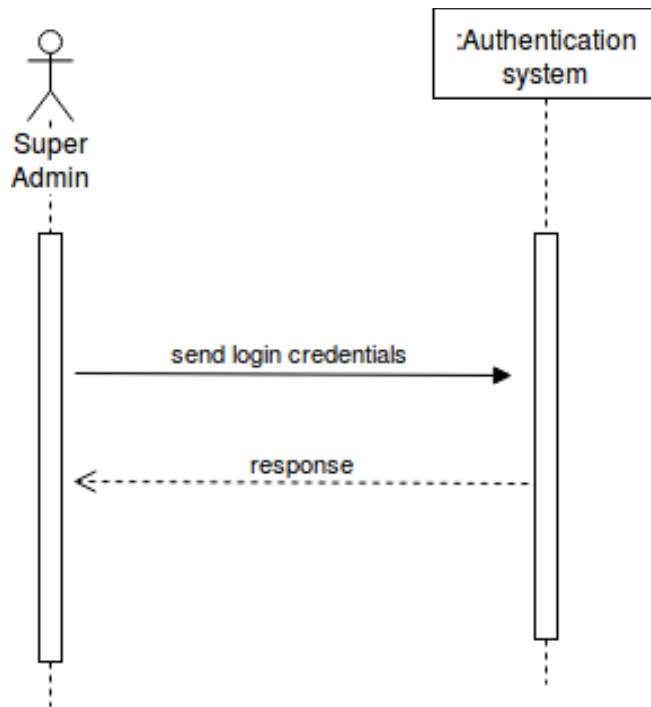

1. staff	<p>Class behavior</p> <ul style="list-style-type: none"> all the functions in this class automate the verification of the following functionalities login(): the call center staff is logged in view_patients(): checks whether patients are displayed change_password(): the password of call center staff gets changed logout(): the call center staff is logged out
2. test	<p>Class state</p> <ul style="list-style-type: none"> It contains the driver object It contains the gmail api object which is used for fetching login credentials from gmail <p>Class behavior</p> <ul style="list-style-type: none"> setup(): creates instances for the driver and gmail api classes start(): this method calls all the methods in staff class and prints appropriate messages after automation of each feature stop(): closes the driver connection

Sequence Diagram(s)

Send messages, videos, article, edit patient:

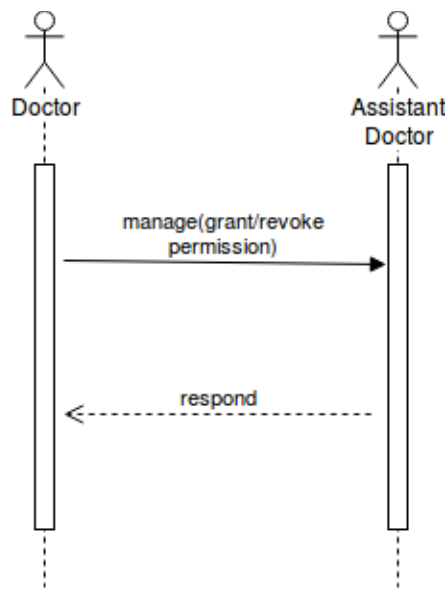

Login:

Edit profile:

Manage assistant:

Design Rationale

- 1) Used config file to store the URL, email ids, passwords, counts and various other counts. In the beginning we use to make changes in the actual files(search for the ids,...). Now it has become easy because we can directly make the changes in the config file.
- 2) Changed the if conditions to while loops in Hospital Admin add_staff function. This made our task easier because we can now get the login credentials and store them as a group instead of separately getting the login credentials and then combining them.
- 3) During the process of automation we found some things(surgery description was not getting added in patient, after password change we are getting redirected to an error page, user name getting changed only after re-login when profile is edited) which need to be changed in the website.
